

## **Kitchener Wheel Loader Training**

Kitchener Wheel Loader Training - The two most common types of heavy equipment training are categorized into the categories of machinery; machinery that is fashioned with rubber tires or those with tracks. The tracked vehicle are heavy duty machines such as excavators, cranes, and bulldozers. They make up the most common kind of heavy equipment training. Typically, the rubber tire training involves the rubber-tired versions of earth movers, end loaders and cranes. Heavy equipment training also involves using various rubber-tired vehicles like scrapers, dump trucks and graders. Training centers often provide truck driver training for the different types of heavy equipment training.

The majority of all heavy machinery runs on diesel fuel and as such, the basics of diesel mechanics are a major part of heavy equipment training. Usually, a basic program on diesel mechanics is typically required of those training. Among the main goals of the course are to be able to teach an operator about maintenance procedures and basic troubleshooting in the event of a problem with the equipment. Usually, this training saves a mechanic from being called out in the middle of the night simply because a piece of machinery requires the addition of something minor like engine oil. Diesel mechanics for heavy machinery is an education all unto its own; therefore, extensive training is not normally provided in the course book for the general training program.
